Job Market Paper

“Parental Job Loss and Geographic Mobility” with James Reeves

FSRDC Project #2854. Results undergoing U.S. Census Bureau disclosure review.

Abstract: Prior work on the intergenerational effects of parental job loss has given limited attention to how increased geographic mobility among displaced workers affects children. In this paper, we study the impacts of parental job loss on children’s geographic mobility, neighborhood quality, and long-run human capital. Using restricted-use Census microdata, we identify children’s exposure to parental job loss using mass layoff events from 2006-2016. On average following parental job loss, children observe a rise in commuting zone outmigration and move to subsequently worse neighborhoods. However, returns to mobility vary substantially across locations, masking large beneficial effects from outmigration for many families. We leverage this variation using a measure of commuting zone-level labor market scarring following the Great Recession, finding that children exposed to job loss in weaker labor markets observe an additional increase in CZ outmigration rates and experience gains in neighborhood quality. We find evidence this exposure to better neighborhoods improves children’s long-run human capital accumulation: children exposed to parental job loss in scarred labor markets observe an increase in college attendance at typical college-going ages. These findings highlight the important mediating role of geographic mobility and large spatial variation that accompanies it.
